Background

■ Conventional Seismic Retrofit Tech

Noise ·
vibration · dust

Activity is interrupted
due to retrofit works

■ Required Tech.

- short construction period
- small noise and vibration

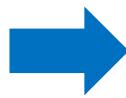

→ without post-installed anchors

■ Recent Earthquake Damage for R/C structures

Demolished R/C condo. satisfied current code
due to Non-structural walls damage

AIJ Tohoku Branch : The 2011 Tohoku EQ damage investigation
report, 2013.5

■ Required Seismic Retrofit Effects

- damage reduction
- max response reduction

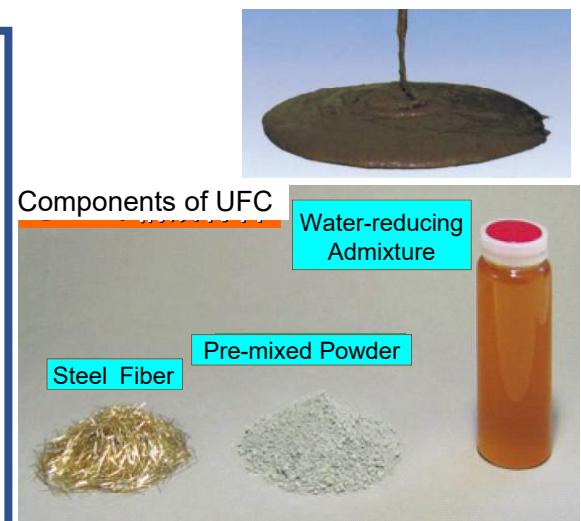

Purpose

- Target : existing medium-rise R/C buildings satisfied current code
- Development of retrofit technique
 - 1. Reduce maximum EQ response and damage level of members
 - 2. Easy construction work

Utilize Precast Ultra high strength Fiber Concrete (UFC) wall panel

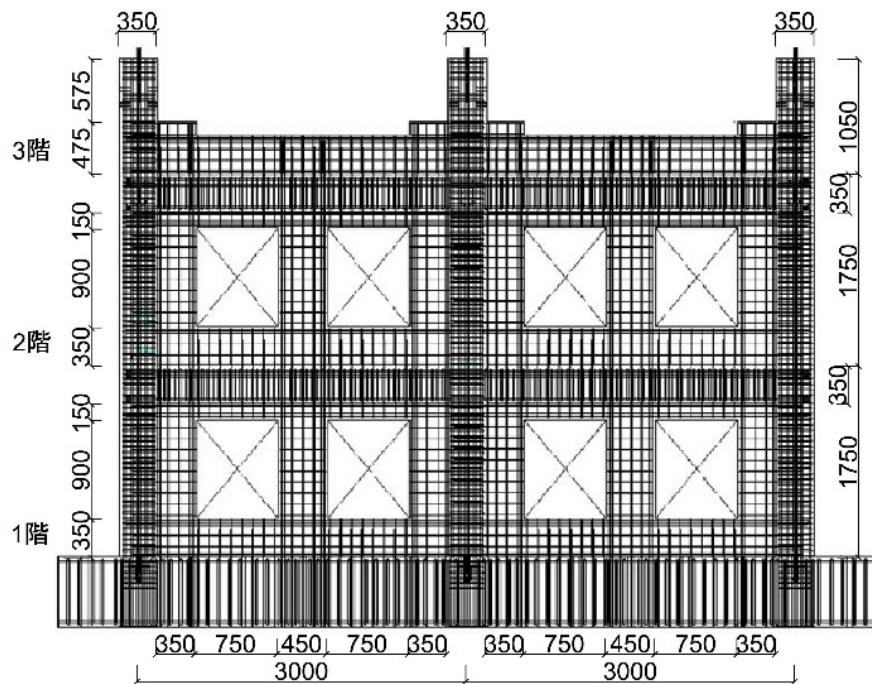

Structural test was done considering followings;

- ① Improve horizontal deformability of frame
- ② Reduce damage of non-structural RC walls
- ③ Control collapse mechanism

Specimen : reinfo. arrangement

Typical government office : 2 story+2span
Non-structural RC walls

Scale	1/2						
RC wall Thickness	60mm						
Concrete Compressive strength	30Mpa in design

Axial force ratio	Outside 0.075, Inside 0.15						

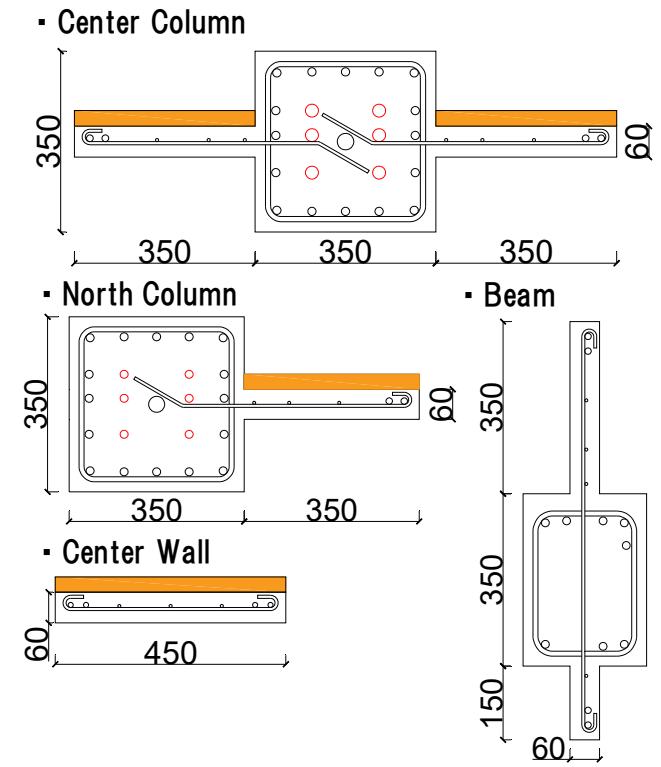

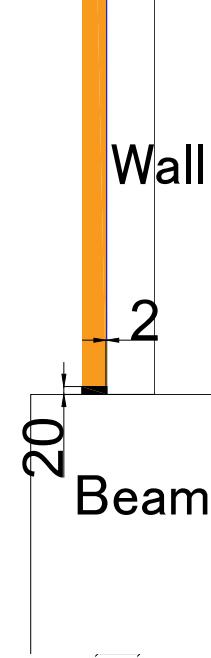

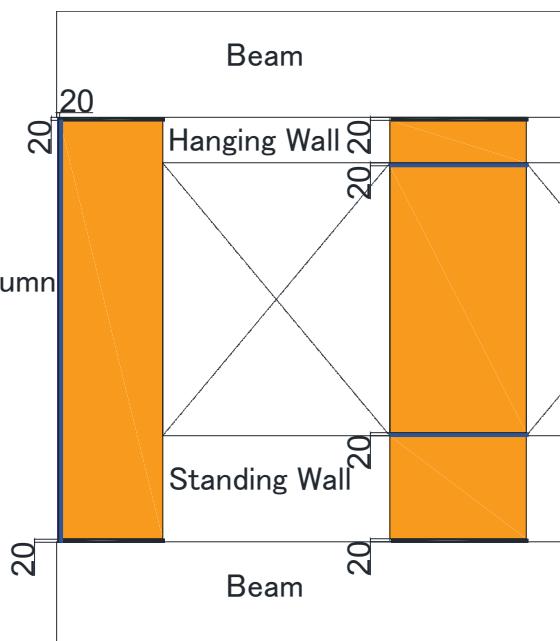

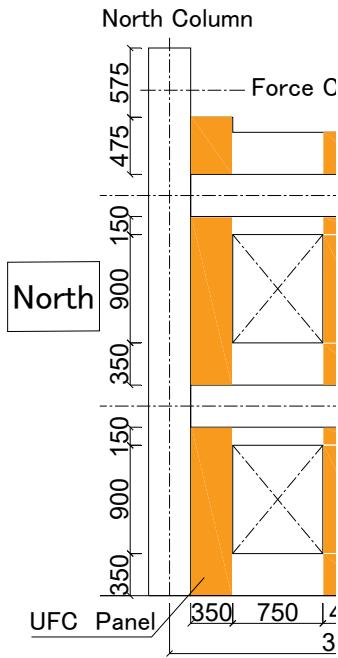

Outline of Seismic Retrofit

UFC panels are pasted on the non-structural wall face from one side using the epoxy resin adhesive

The gaps between beam and UFC panel : high strength non-shrinkage mortar

The other gaps: epoxy resin

Used Materials

Steel, Concrete, Epoxy resin adhesive , UFC, High strength non-shrinkage mortar

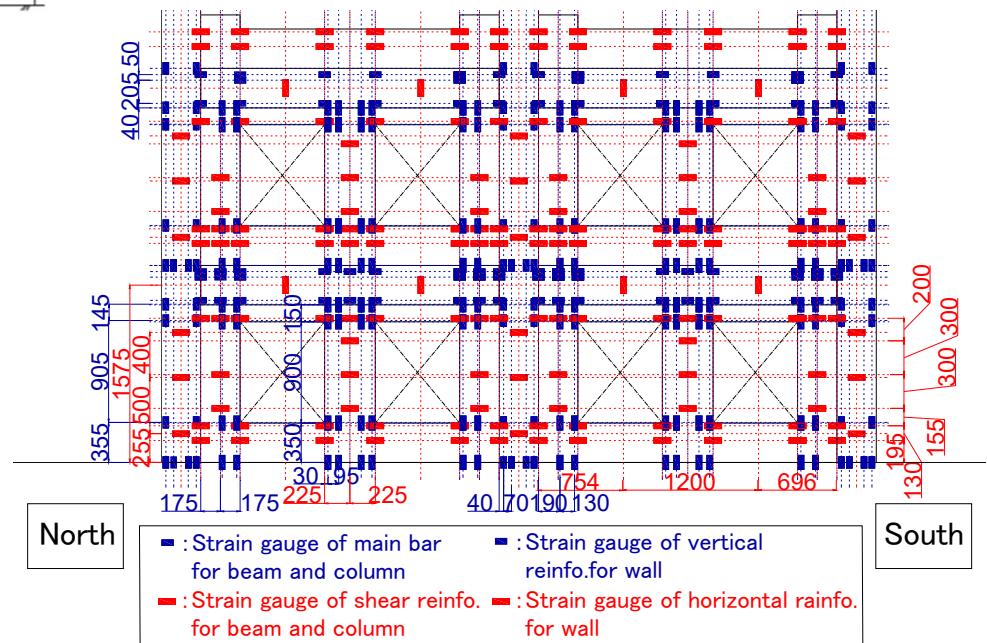

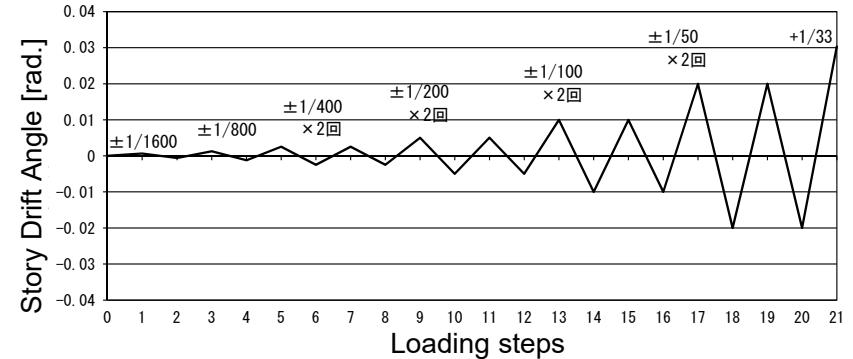

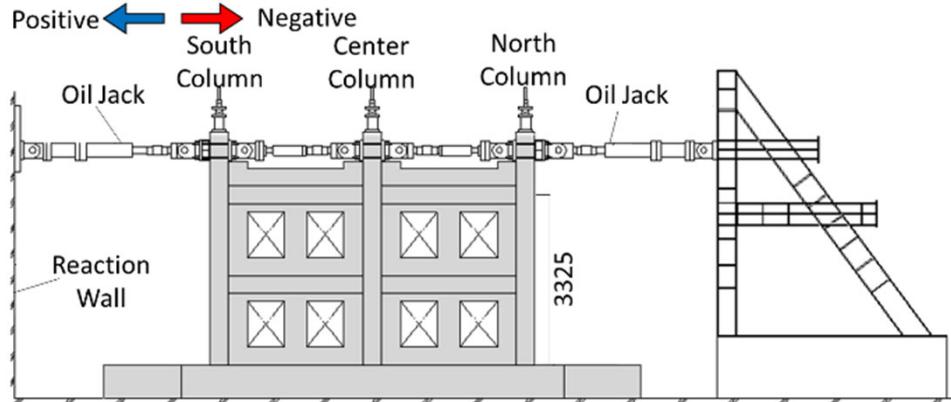

Reinforcing bars Components	Diameter	Grade	Yield strength (N/mm ²)	Young's Modulus (kN/mm ²)
Main bar for beam & column	D16	SD345	391	191
Edge bar for wing, standing and hanging walls	D13	SD295A	338	182
Edge bar for center walls	D10	SD390	402	187
Shear reinforcement	D10	SD295A	350	180
Bar of walls	D6	SD295A	346	185

Concrete	Compressive strength (N/mm ²)
Story	38.2
Top story	36.8
2 nd story	39.8

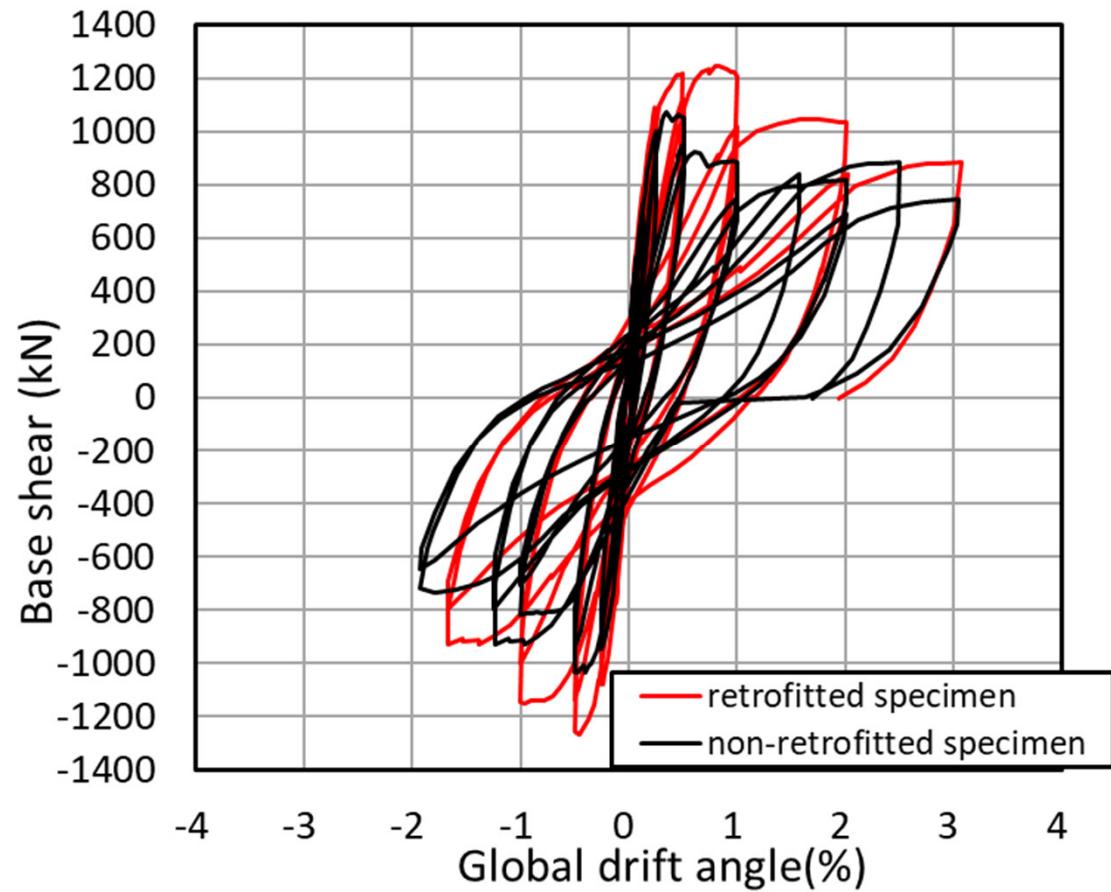

UFC	Compressive strength (N/mm ²)	Flexural strength (N/mm ²)	Young's Modulus (kN/mm ²)	Non-shrinkage mortar	Compressive strength (N/mm ²)	Tensile strength (N/mm ²)	Young's Modulus (kN/mm ²)
	220	38.3	54.0		106	8.86	30.7

Loading and Measurement Plan

Test Results : Seismic Retrofit Effects1

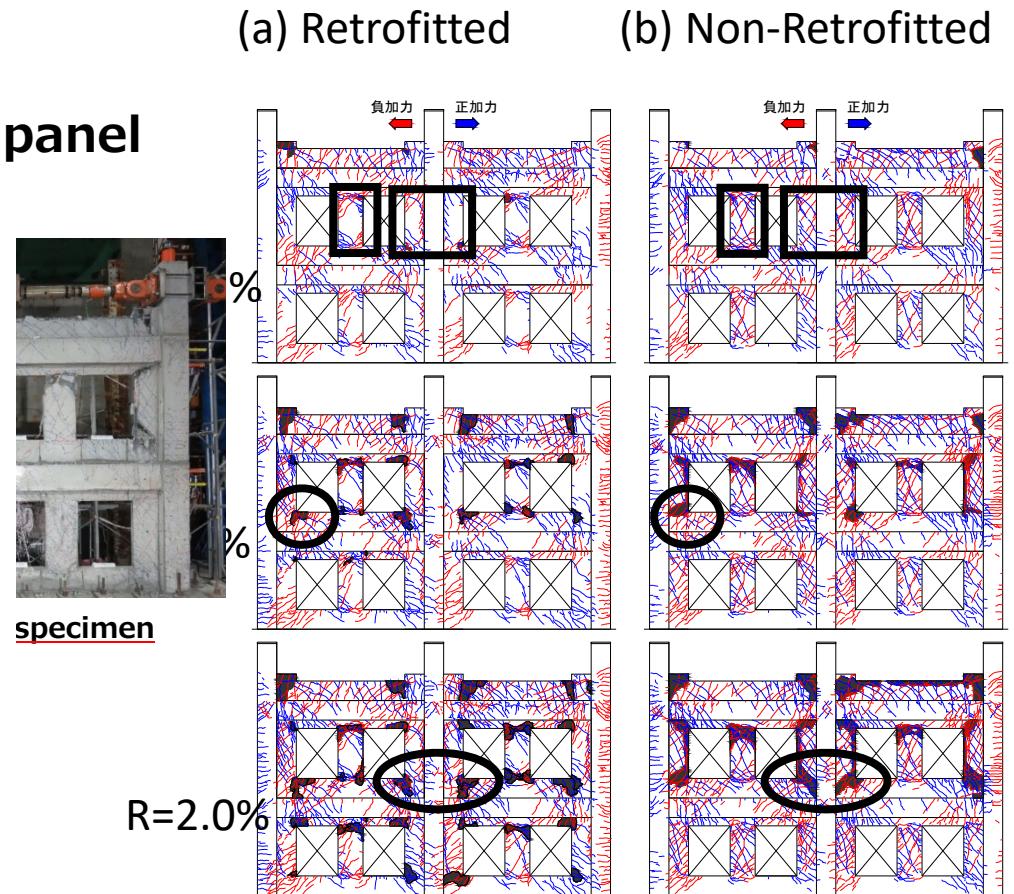

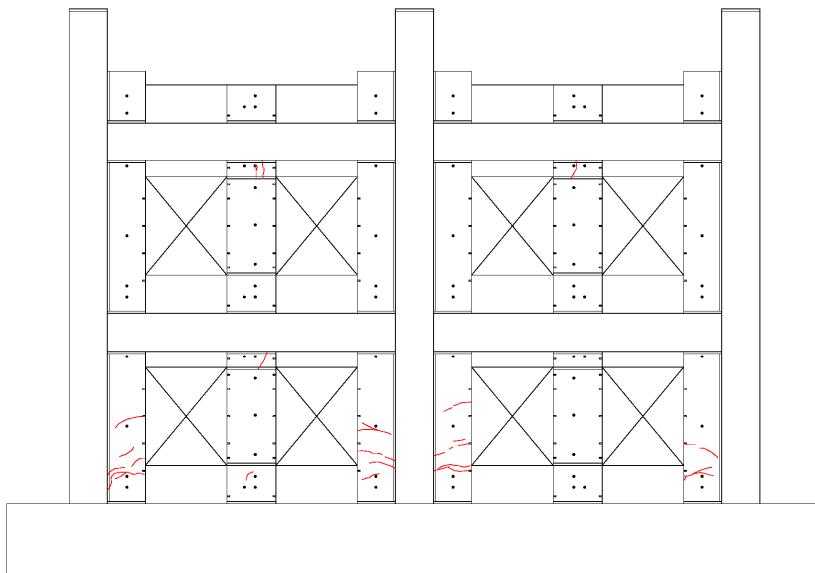

■ Observed Effects1 :

- ① improve maximum strength
- ② improve ductility (around R=1%)

Test Results : Seismic Retrofit Effects2

After Loading 力
Damage of UFC panel

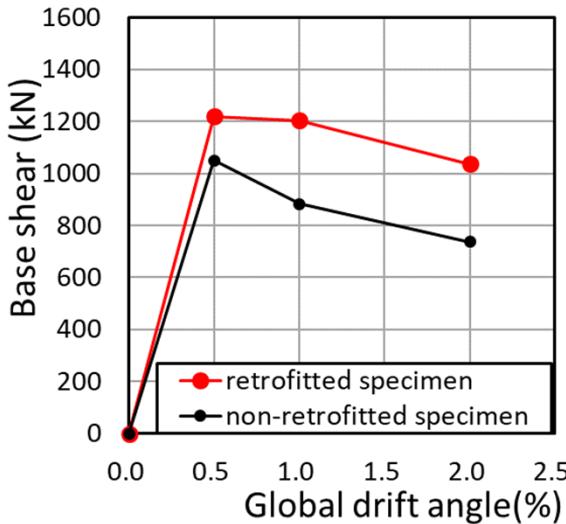

■ Observed Effects2 :

1. Reduce non-structural R/C walls damage
2. Change damage distribution due to ultimate flexural strength with UFC(Collapse Mechanism Control 01)

Test Results : Seismic Retrofit Effects3

- : Yield of main bar in beam & column
- : Yield of edge reinforcement in wing and center walls
- : Yield of edge reinforcement in standing and hanging walls

- △ : Yield of shear reinforcement in beam and column
- ▲ : Yield of horizontal reinforcement in wing and center walls

R=0.5%

Change of
yielding
distribution by
UFC rotational
behavior

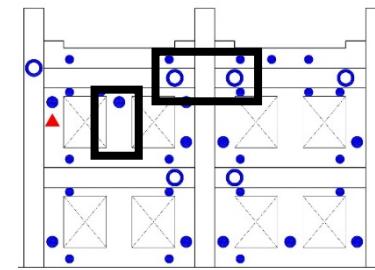

R=1.0%

Change of
yielding position
of main bars at
1st story column

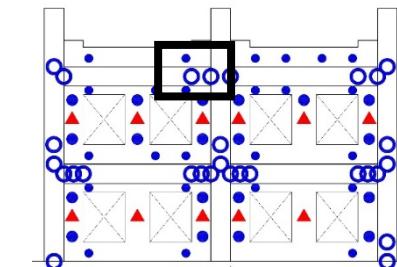

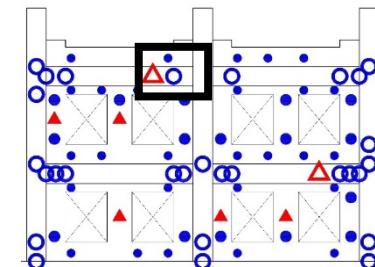

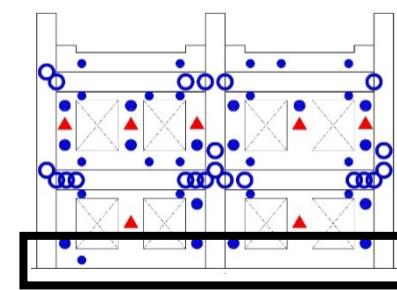

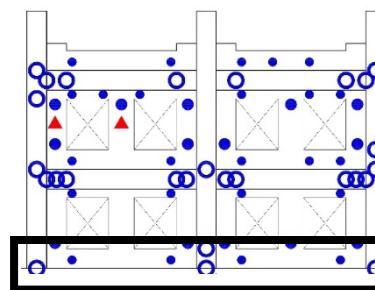

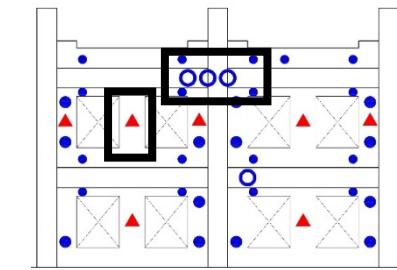

R=2.0%

Change of
yielding of
shear reinfo. at
3rd story beam

(a) Retrofitted

(b) Non-Retrofitted

■ Observed Effects3 :

- ① Change of yielding distribution (Collapse Mechanism Control 02)

11

Conclusions

Structural test for 2 story-2span R/C frame retrofitted by UFC panels was implemented and following knowledge were obtained.

Seismic Retrofit Effect1 : Improvement of deformability
Maximum strength was kept until $R=1.0\%$, strength deterioration was controlled until $R=2.0\%$.

Seismic Retrofit Effect2 : Reduction of non-structural wall damage
Damage reduction of retrofitted members at deformation level around maximum strength was observed.

Seismic Retrofit Effect3 : Collapse mechanism control
Collapse mechanism was changed from story collapse to overall collapse by the seismic retrofit, story horizontal deformation distribution was improved.

Test Results Non-retrofitted Specimen
